### **Description**

The project is created based on a library management app. The app using proper login handles with flask security creates a new librarian and user. A librarian is an admin who can create sections(book genre) and assign books to it. A user can request for the book and return the book and can give feedback on the book . Users can also read the issued book.

Functionalities used in the app

- Flask framework is used to handle the logic of the backend and to handle Restful\_API endpoints to successfully run CRUD operations.
- SQLite is used to create the database and manage all the cores of the application.
- Bootstrap is used to style and render the page beautifully.
- Vue.js framework is used to handle the frontend part of the code and form the view logic of the app.
- Celery and Redis are used to do the backend hidden jobs for the application such as exporting the details, alerting users,by sending mails and generating reports.
- Flask Security is used to authenticate and authorize particular tasks to the user and admin.
- Axios is used to get the http requests to handle the error and to build an SPA.
- SQL-Alchemy to create the relational mapping and interact with the database..
- Javascript , Python, html/css.

### **Database Schema Design**

- 1) User ( user\_id, username, email, password, active, fs\_uniquifier, roles(relationship))
- 2) Role (role\_id, name)
- 3) Roles\_users (user\_id, role\_id)

- 4) Section ( user\_id, sec\_id, sec\_name, description, books(relationship))- to keep books
- 5) Book (user\_id, sec\_id, book\_id, title, author, description, price, request(relationship),)- books assigned to sections
- 6) Request ( req\_id, book\_id, title, user\_id, request\_date, expiry\_date)- books requested by users
- 7) Feedback ( feed\_id, user\_id, book\_id, title, feedback)- feedback for books

## Architecture of the app

All the files maintained particularly to serve the neatness of the library management app.

```

    < static
      < components
        JS home.js
        JS issue.js
        JS librarian_dashboard.js
        JS login.js
        JS readbook.js
        JS signup.js
        JS user_dashboard.js
        JS userbook.js
      < images
        📸 library.jpg
      JS app.js
    < templates
      <> index.html
      <> monthly_issue_report.html
    ⚡ api.py
    ⚒ celerybeat-schedule
    ⚒ communication.py
    ⚒ config.py
    ⚒ error.py
    ⚒ main.py
    ⚒ models.py
    ⚒ requirements.txt
    ⚒ requirements1.txt
    ⚒ sec.py
    ⚒ tasks.py
    ⚒ worker.py
  
```
